PROFESSIONAL SUMMARY

Fresher B.Tech graduate in Artificial Intelligence & Data Science with online training in machine learning and data science. Completed hands-on projects in NLP-based fraud detection using Python, Scikit-Learn, and PyTorch. Quick learner with strong foundational skills in ML, Deep learning, Generative AI, data analysis, and Python programming, looking to grow in an entry-level data science or machine learning role.

PROFESSIONAL EXPERIENCE

Software Engineer | **Deepvibe IT Solutions Pvt. Ltd., Hyderabad** *Oct 2025 – Mar 2026*

RideConnect – Driver Booking Platform

- Engineered and deployed a production-ready full-stack driver booking application using React, Node.js, Express.js, and MongoDB; architected RESTful APIs with JWT authentication, input validation, and error handling.
- Reduced manual deployment effort by ~60% via Vercel CI/CD pipelines; implemented microservices-style modular architecture with role-based access control (RBAC) for improved scalability and maintainability.
- Collaborated with designers and stakeholders to translate business requirements into responsive, high-availability full-stack solutions, improving overall user experience.
- Conducted code reviews, enforced coding standards, and maintained unit testing practices using Jest to ensure high code quality across the codebase.

PROJECTS

Fraud Detection in Online Product Review System | Final Year Project

- Designed and developed an automated ML-based fraud detection system using NLP techniques to classify online product reviews as genuine or fraudulent, reducing manual review effort and improving e-commerce reliability.
- Extracted and engineered key textual features from a labeled dataset of product reviews using NLP preprocessing pipelines; trained and evaluated multiple classifiers — Naive Bayes, SVM, Logistic Regression, and Decision Tree.
- Implemented a Voting Classifier ensemble combining all four models to improve overall accuracy and robustness, with SVM achieving the highest individual accuracy among all tested classifiers.
- System successfully automates fraudulent review detection, reducing human intervention and fostering greater consumer trust in e-commerce platforms for more informed purchasing decisions.

ChronoAI – AI-Powered Task Scheduling System | Deepvibe IT Solutions

- Architected backend using FastAPI + Uvicorn with MongoDB (Motor async driver) for non-blocking, high-concurrency task and notification management.
- Built rule-based NLP engine (Python re + dateparser) for natural language date-time parsing, replacing external LLM/AI API dependencies entirely.
- Developed multi-agent dispatcher for task execution routing and a WebSocket Manager for real-time client updates on task state changes.
- Applied Pydantic data validation, CORS middleware, Python logging, and UTC-consistent datetime handling for a production-ready architecture.

TECHNICAL SKILLS

Programming Languages: Python, SQL.

Frameworks & Libraries: FastAPI, Scikit-Learn, PyTorch, NumPy, Pandas, Matplotlib, TensorFlow

Databases: MongoDB, SQL

Web Development: HTML, CSS, JavaScript

Tools & Platforms: VSCode, Jupyter Notebook, Power BI, Git, GitHub

EDUCATION

B.Tech – Artificial Intelligence & Data Science | **PACE Institute of Technology and Sciences**
2021 – 2025

CGPA: 7.21

ONLINE TRAINING & COURSES

- **Machine Learning Training** | MetchIn Learning Solutions (*Jan 2025 – Jul 2025*)
- **Data Science Training** | 42Learn (*May 2024 – Jul 2024*)

CERTIFICATIONS

- Introduction to Data Science — **Infosys Springboard**
- Introduction to Internet of Things — **NPTEL**
- Machine Learning Fundamentals — **Alteryx**
- Introduction to Cybersecurity — **Palo Alto Networks**
- AWS Data Engineering — **AWS Academy**
- AWS Cloud Foundations — **AWS Academy**
